

Paride Papadia: (<https://orcid.org/0000-0001-9611-3824>) holds a degree in Chemistry and a Ph.D. in Chemistry of Drugs. Following a postdoc researcher position on the subject: "Metal complexes as fundamental tools for complex molecular systems synthesis", he became Assistant Professor in Inorganic Chemistry (SSD CHIM/03) in the Department of Biological and Environmental Sciences and Technologies of the University of Salento (Lecce, Italy), where he has been teaching General and Inorganic Chemistry for the Bachelor Degree in Environmental Sciences and Technologies. His main research interests are: Study of anticancer platinum complexes' structure, reactivity, dynamic behaviour, drug-delivery, and interaction with biomolecules; Structural characterization of metabolites of biochemical and pharmaceutical interest; Application of NMR spectroscopy, coupled with multivariate statistical analysis, to the evaluation of metabolic profiles for biomedical and food farming industry applications; Uptake and environmental impact of metal ions in plants, animals, and ecosystems. He is co-author of 39 international peer reviewed papers and has an h-index of 16.
